PRODUCT DESCRIPTION

产品描述

The pressure difference between the boiling film and condensing surface is the driven force of stem flow, and the minimum pressure will cause the flowing of steam. Under the 1mbar, the operation requires the boiling surface and condensing surface have the shortest distance. The evaporator manufactured based on the principle is called short-path distillation. The short-path distillation (molecular distillation) is equipped with a inside condenser which is opposite to the heating surface, and make the operation pressure reduce to under 0.001mbar. Its relative low boiling temperature is very suitable to the material with heat sensitive and high boiling point.

Basic constitution: the column cylinder equipped with outside heating mantle, rotor and inside condenser. The fixing frame of rotor is precisely equipped with scratch film and anti-splash device. The inside condenser is placed in the center of evaporator, and the rotor should rotor between column cylinder and condenser.

Distillation process: The material should add from the top of evaporator and continuously spread to the heating surface through the material covered on rotor. Then, the scratch film is capable of scratching the material into a thin and flowing liquid film. During this process, the light molecular exceeded the heating surface form the condense liquid on inside condenser without any collision. Then, the molecular flows along the condenser tube, and discharge through the discharge tube on the bottom of evaporator. The residue liquid (heavy molecule) is collected on the circular channel under the heating zone, and flows through the discharge tube on one side.

沸腾薄膜和冷凝表面之间的压力差是液体流动的驱动力，最小压力将导致蒸汽流动。在1mbar下，操作需要沸腾表面和冷凝表面具有最短距离。基于该原理制造的蒸发器称为短程蒸馏。短程蒸馏（分子蒸馏）配备有与加热表面相对的内部冷凝器，并使操作压力降至0.001mbar以下。其相对较低的沸点温度非常适合具有热敏性和高沸点的材料。

基本构成：柱缸配有外加热罩，转子和内冷凝器。转子固定架精确配有刮膜和防溅装置。内部冷凝器放置在蒸发器的中心，转子应在柱筒和冷凝器之间转子。

蒸馏过程：材料应从蒸发器顶部加入，并通过转子上覆盖的材料连续扩散到加热表面。然后，刮膜能够将材料刮擦成薄且流动的液膜。在此过程中，轻分子超过加热表面，在冷凝器内部形成冷凝液而没有任何碰撞。然后，分子沿着冷凝管流动，并通过蒸发器底部的排放管排出。

残留液（重分子）被收集在加热区下方的圆形通道上，并在一侧流过放电管。
